

**CSSA B-3 BIOREACTOR OPERATIONS  
PERFORMANCE STATUS REPORT  
(QUARTER 11, MONTHS 31 – 33, NOVEMBER, 2009 – JANUARY, 2010)**

**MARCH 11, 2010**

---

---

This status report summarizes the operation of a bioreactor at Solid Waste Management Unit (SWMU) B-3 from November 1, 2009 through January 31, 2010, comprising the eleventh quarter of bioreactor operations and monitoring since system start-up. This status report includes descriptions of current conditions, field observations, analytical results, and an anticipated schedule of activities for the next reporting period. Analytical results from monthly and quarterly regulatory and performance sampling through January 2010 are attached for reference. Parsons personnel working on this project during the reporting period include Ken Rice, Samantha Elliott, Eric Tennyson, Adrien Lindley, Julie Bouch, Michael Zugelder, Scott Pearson, Edward Galbavy, William Martin, and Justin Kirk.

***Executive Summary***

Site conditions were seasonal and wet through the quarter with 7.54 inches of precipitation reported. Injection of extracted groundwater continued through the quarter with few interruptions. Minor interruptions include: winterizing, reaching automatic cut-off levels in the wells and/or storage tank, and reaching the high water level automatic cut-off level in trench 1. Approximately 22,176,859 gallons of groundwater extracted from CS-MW16-LGR, CS-MW16-CC, and B3-EXW01 have been injected into bioreactor trenches 1 and 2 since the start of normal operations. During quarter 11, a total of 2,804,864 gallons of extracted groundwater from wells CS-MW16-LGR, CS-MW16-CC, and B3-EXW01 were injected into the bioreactor. The majority of extracted groundwater, ~1,473,000 gallons, was from CS-B3-EXW01, while ~861,000 gallons was extracted from CS-MW16-CC, and 471,000 gallons were extracted from CS-MW16-LGR.

Data from monitoring efforts indicate that the B-3 bioreactor has continued to maintain appropriate geochemical conditions for effective anaerobic dechlorination of chlorinated aliphatic hydrocarbons (CAHs). Geochemical parameters indicating optimal conditions include the following:

- Concentrations of dissolved oxygen (DO) are generally less than 0.5 milligrams per liter (mg/L) and oxidation-reduction potential (ORP) values are less than -100 millivolts (mV), indicating an anaerobic environment conducive to dechlorination of CAHs within the trenches;
- Production of methane indicating that fermentation is occurring; and
- Hydrogen concentrations are greater than 1.0 nanomoles per liter (nmol/L), indicating that there is sufficient electron donor present to stimulate anaerobic dechlorination of CAHs.

Analytical results for samples collected in trench 1 sumps provide evidence that biotic and abiotic dechlorination of trichloroethene (TCE) is occurring. The consistent presence of the end product ethene provides evidence that the biotic reductive dechlorination process appears to be the major pathway for degradation of CAHs within trench 1. Additionally, two other degradation mechanisms, both biotic and abiotic, appear to be occurring within trench 1.

It appears that biotic anaerobic oxidation of CAHs to carbon dioxide may be occurring with Mn (IV) as the terminal electron acceptor. This degradation pathway reaction results in the production of the reduced form of manganese [Mn (II)]. The detections of high concentrations of Mn(II) in trench 1 may be the result of this biotic process.

Evidence for the existence of an abiotic reductive dechlorination is indicated by the presence of reduced iron [Fe(II)] and trans-DCE in trench 1. Field sampling analyses (Noblis) indicated positive results for hydrogen sulfide and sulfate-reducing bacteria. Hydrogen sulfide likely reduces iron [III] in soil minerals to iron [II], which is then available to facilitate reductive dechlorination of CAHs. Although evidence suggests this degradation pathway exists, it may not be a significant contributor to the overall degradation of contaminants.

### ***Summary of Bioreactor Operation***

Initial baseline and quarter 1 through quarter 11 analytical results from monitoring of the bioreactor sumps indicate that the SWMU B-3 trenches contain a range of *cis*-DCE levels (7.6 – 120 µg/L – Quarter 11) as well as concentrations of other dechlorination products (e.g., VC, ethene). In addition, minor amounts of toluene, and other fuel related compounds were identified during monitoring of bioreactor sumps from trenches 1 through 6 during the quarter. A summary of the analytical data collected for the reporting period is included in Table 1. A summary of monthly and quarter 11 monitoring results from the bioreactor trench sumps are attached, analytical results of the surrounding SWMU B-3 multi-port monitoring wells (MPMW or Westbay®) and monitoring wells are also attached.

Results of VOC analyses indicate that groundwater from the uppermost saturated zone (LGR-03B) of Westbay® wells CS-WB05 and CS-WB07 contain less than 100 micrograms per liter (µg/L) of PCE and TCE, while *cis*-DCE was detected in concentrations less than 100 µg/L in CS-WB07 and greater than 100 µg/L in CS-WB05. Wells CS-WB06 and CS-WB08 both contain greater than 100 µg/L of PCE, TCE, and *cis*-DCE. Groundwater from CS-MW16-LGR and B3-EWX01 contain greater than 100 µg/L of PCE, TCE, and *cis*-DCE while CS-MW16-CC contains less than 100 µg/L of PCE, TCE, and *cis*-DCE. Quarterly data from the bioreactor trench sumps indicate a decrease in contaminant mass (total molar concentration) in all sumps in trenches 1 and 2 through the quarter. Groundwater samples were only collected in November in sumps T3-1, T3-2, T4-1, T5-1, T5-2, T6-1, and T6-2, however, no significant changes from the previous quarter was indicated, as the total molar concentrations for each sump was less than 20 nM/L. Over the bioreactor operational period, contaminant mass appears stable or decreasing.

Water quality field measurements from the bioreactor trench 1 sumps indicate that DO has risen from the previous quarter to an average of 0.76 mg/L, ORP has risen since the previous quarter, averaging -73.3 mV, pH ~ 6.94, temperatures range from 10.48 °C to 20.05 °C, and specific conductivity ranges from 0.348 to 0.668 millisiemens per centimeter (mS/cm). Other observations regarding the data collected during this reporting period are listed below.

Water quality field measurements from trench 2 include: average DO, pH, and ORP ~0.61 mg/L, ~6.70, and ~ -75 mV, respectively; temperature ranges from 16.38 °C to 25.74 °C; and specific conductivity ranges from 0.343 to 1.208 mS/cm.

Through the 11<sup>th</sup> quarter of bioreactor operation, 7.54 inches of precipitation were measured at the weather stations proximal to the bioreactor site. Average water thickness in Trench 1 during this period is approximately 9.28 feet. Average water thickness in Trench 2 during this period is approximately 4.59 feet.

Attached are graphs including a cumulative total volume of recovered groundwater from CS-MW16-LGR and CS-MW16-CC applied into trench 1, the B-3 Trench 1 average water thickness

with rainfall data and average water applied daily to trench 1, the CVOC concentrations in CS-MW16-LGR, and the water level elevations in the defined uppermost saturated zone (zone LGR-03B) of the B-3 multi-port monitoring wells with rainfall data.

### ***Analytical Data Observations***

1. Arsenic (As) was detected in concentrations exceeding the MCL (10 µg/L) in trench samples collected at T2-2 (16.8 µg/L), T3-1 (18.7 µg/L), and T5-2 (20.2 µg/L) during quarter 11. Manganese (Mn) was reported in bioreactor trench water samples at concentrations ranging from non-detect to 1,960 µg/L (MCL is 50 µg/L). An elevated level of Mn was reported in CS-B3-MW01 (125 µg/L) during this quarter. Arsenic was not detected in any of the monitoring wells surrounding the bioreactor during the quarter. Elevated levels of Mn were reported in CS-WB06-UGR01 (201 µg/L), CS-WB08-UGR01 (408 µg/L) and CS-WB05-LGR-04B (51.6 µg/L), and elevated levels of As were reported in CS-WB05-LGR04B (27.1 µg/L); all other MPMW zones reported Mn and As levels below the MCL. The elevated levels are likely due to changing pH conditions of the groundwater and the reduction of naturally occurring As and Mn within the limestone media to more soluble forms. Additionally, the biotic anaerobic oxidation pathway of CAHs may also be contributing to the elevated levels of Mn within the treatment system.
2. Lead levels in groundwater collected from CS-B3-EXW01 reached 30.6 µg/L, exceeding the drinking water Action Level (15 µg/L). Lead monitoring in groundwater will continue as Bioreactor operations progress.
3. DO and ORP values were less favorable for the reduction of CAHs compared with the previous quarter, however, it is likely that geochemical conditions will improve as flood test operations cease and normal bioreactor operations ensue.
4. The volatile organic compound summary for the trenches indicates a continuation of a predominately a three-component (VC, DCE isomer, and ethene) chemical composition in water collected from the trench sumps. This indicates the further reduction of contaminants along the degradation pathway toward the end product ethene. Total molar concentrations in sumps in trenches 1 and 2 decreased through the quarter. The trans-DCE isomer in trenches 1 and 2 is theorized to be the result of an abiotic reductive dechlorination pathway.
5. Reductive dechlorination of CAHs by microbial activity other than DHC appears to be occurring as DHC bacterial counts have been negligible.
6. Saturated conditions within the bioreactor are maintained through the quarter with average water thicknesses of approximately 9.28 feet and 4.59 feet in trenches 1 and 2, respectively.

### ***Anticipated Schedule for Next Period (November, 2009 – January, 2009):***

- Continue monitoring and maintenance activities for delivery of groundwater to the bioreactor trenches.
- Complete the integration of system controls with SCADA.
- Conduct monthly monitoring events in February and March (Months 34 and 35), and quarterly monitoring event in April (Month 36) for bioreactor system.
- Continue UIC monthly monitoring with semi-annual reporting due June 2010.
- Begin construction of 8 shallow piezometers around the bioreactor.

- Complete the design phase/begin construction of a fourth extraction well to deliver groundwater to the bioreactor.

## **Specific Data Observation Notes for Attachments**

- Analytical results from the B-3 Trench Sump (trenches 1 through 6) samples, shown in Table 11.1.2, present data from the quarter 11 sampling events.
- Table 11.1.1 indicates a water thickness of approximately 9.28 feet in trench 1 and 4.59 feet in trench 2 was maintained.
- Table 11.1.2 indicates that VC was present at moderate concentrations in trench sumps, ranging from 0.54 to 50 µg/L in trench 1 and from non-detect to 80 µg/L in trench 2. Ethene was observed in concentrations ranging from ND to 3.9 µg/L in trench 1 and non-detect to 7.7 µg/L in trench 2.
- Table 11.1.3 indicates that Mn(II) and Fe(II) were present at concentrations consistent with alternative degradation pathways. Additionally, Table 11.1.3 provides evidence of the biotic anaerobic degradation pathway with the elevated concentrations of Mn and CO<sub>2</sub>.
- Table 11.3.3 indicates that VC was present (5.1 µg/L) in the sample taken from monitoring well CS-B3-MW01, which remains consistent with samples collected through the previous 32 months. Additionally, table 11.3.3 indicates that VC concentrations in groundwater samples collected from the new extraction well (B3-EXW01) have decreased from 15 µg/L (July, 2009) to non-detect in January, however lead has increased from non-detect to 30.6 µg/L in the last quarter.
- Table 11.4.4 indicates that the *Dehalococcoides* (DHC) bacteria populations are very low in the trench sumps.
- The changes in molar fraction and total molar concentrations shown in graphs of quarter 11 trenches 1 and 2sumps indicate a continued reduction in contaminant mass to end products VC and ethene.
- Figure 11.2.5 shows that the water levels in Westbay wells are significantly influenced by precipitation and pumping at CS-MW16-LGR and CS-B3-EXW01.
